4 Dataset

MIMIC is a large and comprehensive dataset consisting of de-identified health data associated with ~40,000 critical care patients. It includes features such as patient demographics, vital signs, laboratory tests, medications and medical interventions. We used **46 clinical features** to denote each state. For actions, we defined a discrete **5 x 5 action space** for the medical interventions spanning the space of intravenous (IV) fluid and maximum vasopressor (VP) dosage in a given 4 hour window. **Rewards were set to +15 for the last step in episodes where the patient was released from the hospital and to -15** for when the hospital stay had resulted in death of the patient. The data processing task was a major undertaking as it involved writing many SQL and R scripts and working with +60GB of data.

5 Simulator Results

	Performance on Test Dataset	Metric
State Model	0.1161	Mean Squared Error
Episode Termination Model	97.20%	Accuracy
Outcome Prediction Model	86.31%	Accuracy

The diagram illustrates the OpenAI GPT-3 architecture, showing the flow of data from input tokens through multiple layers of dense and transformer blocks to produce final hidden states and actions.

OpenAI Logo: The logo features a stylized 'O' with a hexagonal pattern inside, followed by the text 'OpenAI'.

Architecture Components:

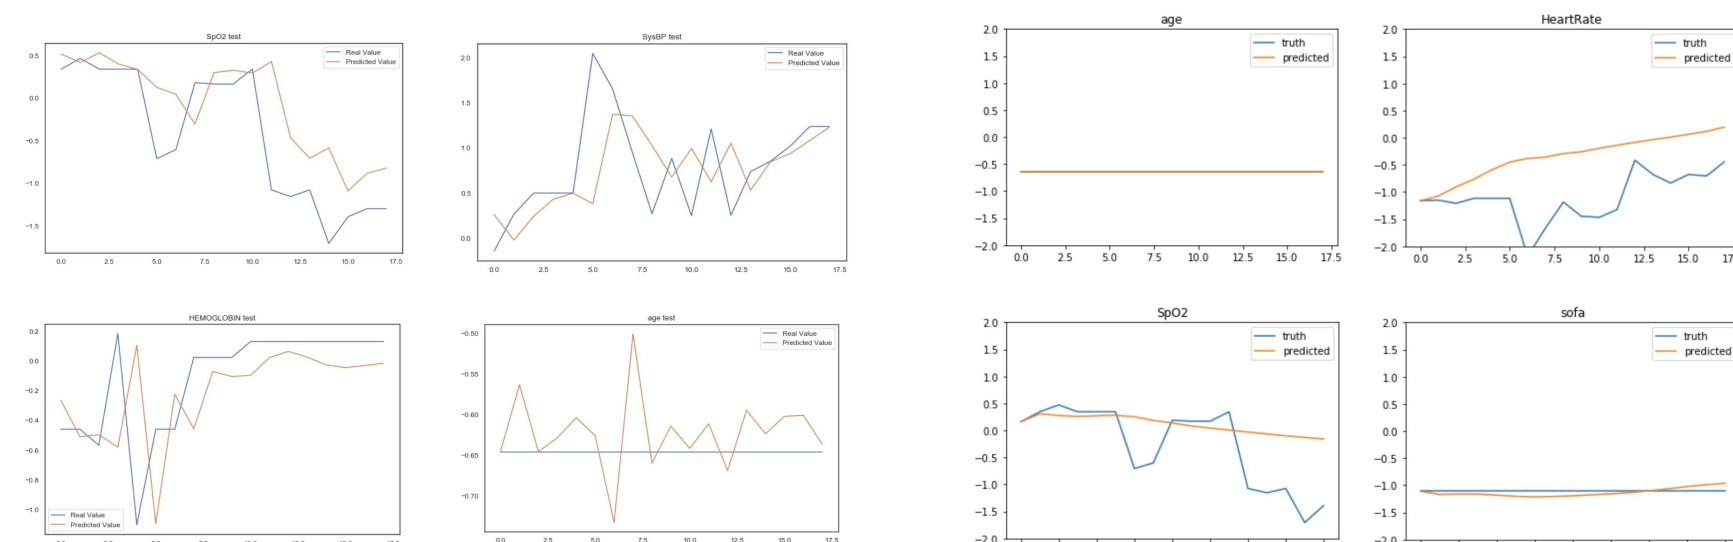

- Input Tokens:** A sequence of tokens: [me, is, it, a, ...].
- 50 Node Dense Layer:** The first layer of the network.
- 128 Node Dense Layer:** The second layer of the network.
- LSTM Layers:** A sequence of LSTM units (LSTM 1, LSTM 2, ..., LSTM 50) that process the input tokens.
- Softmax Layer:** A layer that outputs probabilities for the next token.
- Next State (96 Features):** The output of the LSTM layers, represented as a vector of 96 features.
- Hidden States:** The output of the dense layers, represented as a vector of 50 features.
- Final Output:** A sequence of tokens: [me, is, it, a, ...] followed by 'Action'.

Flow: The input tokens are processed by the 50 Node Dense Layer, then the 128 Node Dense Layer, and finally the LSTM layers. The output of the LSTM layers is the Next State (96 Features). The output of the dense layers is the Hidden States. The final output is a sequence of tokens followed by an Action.

Figure 1 consists of four histograms arranged in a 2x2 grid. The top row shows the distribution of episode lengths, and the bottom row shows the distribution of rewards. The left column represents the simulator environment, and the right column represents the real world environment.

- Top Left: Length of Episodes Using Physician's Policy on Simulator**
 - X-axis: Length of Episodes (2 to 12)
 - Y-axis: Frequency (0 to 1750)
 - Distribution: Most episodes are short (length 2-6), with a significant peak at length 12 (frequency ~1750).
- Top Right: Length of Episodes Using Physician's Policy in Real World**
 - X-axis: Length of Episodes (2.5 to 17.5)
 - Y-axis: Frequency (0 to 1000)
 - Distribution: Most episodes are short (length 2.5-7.5), with a significant peak at length 15 (frequency ~1000).
- Bottom Left: Rewards for Physician's Policy on Simulator**
 - X-axis: Rewards (-15 to 15)
 - Y-axis: Frequency (0 to 2500)
 - Distribution: Most rewards are negative (between -15 and -5), with a significant peak at reward 15 (frequency ~2500).
- Bottom Right: Rewards for Physician's Policy in Real World**
 - X-axis: Rewards (-15 to 15)
 - Y-axis: Frequency (0 to 3000)
 - Distribution: Most rewards are negative (between -15 and -5), with a significant peak at reward 15 (frequency ~2800).

Policy Rollout on Simulator

6 Training using OpenAI Baselines

Potential additions to this work include: (1) leveraging Variational Autoencoders to denoise the data and improve the state model (2) building a stochastic model for the space that accounts of the uncertainties in the feature space (e.g. Deep Bayesian Neural Network) and (3) a visual render mode for the environment.
